

Problem 1 Store Hygiene, Pricing & Official-Seller Verification for accu-chek and Nestle.

🫡 **Problem:** E-commerce agencies managing brand stores manually check whether stores represent the correct brand, product information matches approved sources, prices remain competitive, and suspicious sellers misuse brand identity. These checks are scattered across marketplace pages and brand websites, making exceptions difficult to find, substantiate and act on.
First boundary: Start with the marketplace store homepage. Product-level verification and competitor/seller pricing are the next layer, not claims that a homepage alone can prove.

1. The agency’s actual job

The agency needs an evidence-backed answer to four questions:

1. **Store identity:** Is this the intended brand store, and what evidence supports its official or authorized status?

2. **Store hygiene:** Do displayed brand names, product names, images and key details match the brand's approved information?
3. **Pricing:** How does our price compare with equivalent competitor products and other sellers of the same product?
4. **Seller risk:** Which sellers or stores need investigation because of unusual prices, inconsistent identity, or potentially misleading brand/logo use?

This is a **store-verification and exception-detection problem**, not initially a broad AI copywriting or marketplace-publishing system.

2. Why this problem deserves a solution

- **Repeated manual work:** The same store and product details must be checked across pages, sellers and platforms.
- **Inconsistent references:** A marketplace page may differ from the brand website, approved catalog or packaging.
- **Pricing ambiguity:** A low displayed price may reflect a different pack, variant, coupon, shipping charge or seller-not a genuinely cheaper equivalent product.
- **Trust ambiguity:** Logos and "official" wording are easy to observe but insufficient to establish authorization.
- **Weak evidence trails:** Screenshots, URLs, timestamps and reviewer decisions need to stay attached to each finding.

The proposed value is to reduce repetitive comparison work and give the agency a defensible review queue. These are hypotheses to validate in a pilot; no revenue lift or time-saving percentage is assumed.

3. Use cases supplied for the pilot

Accu-Chek: product and pricing monitoring

- [ ] Confirm the exact brand spelling, target marketplace, market and reference website.
- [ ] Identify publicly listed Accu-Chek products and their variants or pack sizes.

- [ ] Record our listing/seller price and compare it with other sellers of the same product.
- [ ] Separately compare equivalent competing-brand products where relevant.
- [ ] Flag unusually low prices for investigation after checking pack size, condition, coupons, shipping and other comparability factors.
- [ ] Preserve seller identity and brand-use evidence for manual review.

Important distinction: Another seller offering Accu-Chek is a same-brand seller comparison, not necessarily a competing-brand product. A publicly visible listing shows what is offered, not how many units actually sell. Sales volume requires authorized analytics or another reliable sales source.

Nestlé / Lactogrow : homepage identity verification

- [ ] Confirm the intended Nestlé/Lactogrow store URL and market with the brand or agency.
- [ ] Inspect the store homepage first: store name, logo, banner, visible products and any “official” wording.
- [ ] Record seller/store identifiers and any platform verification badge displayed.
- [ ] Compare visible identity with approved Nestlé/Lactogrow brand assets and the relevant official brand website.
- [ ] Check whether an official brand page or approved seller registry links to or identifies this store.
- [ ] Escalate uncertain identity rather than declaring the store official from its logo alone.

These examples define the pilot needs; they are not verified findings about any particular seller.

4. Build first: homepage verification only

Inputs

- [ ] Marketplace store homepage URL.

- [ ] Country/market and platform.
- [ ] Expected brand and store name.
- [ ] Verified official brand website URL.
- [ ] Approved logo and brand assets, including permitted variants.
- [ ] Known official store links, seller IDs or authorization records, where available.

Homepage checks

- [ ] Does the store name match the expected brand identity?
- [ ] Does the visible logo match an approved asset or permitted variation?
- [ ] Are banners and visible product images consistent with the intended brand?
- [ ] Does the page make an “official” or authorized-seller claim?
- [ ] Is a platform verification badge visible, and what does that badge actually indicate?
- [ ] Is the store linked or named by an official brand source or approved authorization record?
- [ ] Are there contradictory names, unrelated products or suspicious identity cues?
- [ ] Is required evidence missing or inaccessible?

Output

- [ ] Store identity result: **supported**, **inconsistent** or **insufficient evidence**.
- [ ] Authorization result shown separately: **verified from recorded source**, **not verified** or **conflicting evidence**.
- [ ] Exact finding and reason.
- [ ] Reference and observed screenshots/URLs with capture timestamps.
- [ ] Confidence and limitations.
- [ ] Recommended agency action and reviewer decision.

Do not claim in this first release: complete SKU hygiene, expiry verification, complete competitor coverage, counterfeit detection or proof of actual sales.

5. Next layer: product hygiene and detail verification

For each selected product, compare the marketplace listing with a market-specific approved product record and official brand information. Start with a small, agreed set of fields not every possible attribute.

Field	What to check	Reference and limit
Brand and product name	Correct brand, spelling, product family and variant	Approved catalog and relevant official product page
Product images	Correct SKU, pack, variant and branding	Approved assets; refreshed packaging may legitimately differ
Size / pack count	Quantity and units agree across title, images and attributes	Approved SKU record; required for fair pricing comparisons
Price	Our price, other-seller price, comparable competitor price and effective unit price	Timestamped marketplace observation; brand website price is only a reference if relevant
Country	Separate country of origin from target selling market	Approved label/product record; website domain does not establish origin
Expiry / shelf life	Distinguish batch expiry from general shelf life and minimum remaining shelf life	Actual batch/stock data or a legible batch image; generic brand pages usually cannot verify delivered-unit expiry

- [ ] Agree the first 3–4 product fields with the agency before implementation.
- [ ] Match exact SKUs before comparing details or prices.
- [ ] Mark missing or unreadable information as **not verified**.
- [ ] Do not turn absence of a field on the homepage into a product failure.
- [ ] Route conflicting references to the agency or brand owner.

6. Pricing : two different comparisons

A. Same product, different sellers

Compare our price with other sellers offering the same brand, SKU, variant, condition and pack size. This supports seller-price monitoring and suspicious-discount review.

B. Competing products

Compare our product with an agreed set of alternatives serving the same purpose. Match relevant specifications and normalize quantity; do not treat different product types as interchangeable just because their prices are similar.

Evidence to capture

- [ ] Product/listing URL and identifier.
- [ ] Seller/store name and identifier where available.
- [ ] Variant, pack count, size, unit and condition.
- [ ] Displayed price, currency, promotion and capture time.
- [ ] Shipping, taxes and coupon conditions where observable.
- [ ] Availability and observed location/account context.
- [ ] Effective comparable price or an explicit “not comparable” reason.
- [ ] Price difference against our matched listing.

Interpretation guardrail: A large discount is an investigation signal, not proof of counterfeit goods, unauthorized selling or trademark infringement. Alert thresholds must be agreed with the agency rather than invented.

7. Brand identity and suspicious sellers

Keep these checks separate:

- **Visual brand match:** Does the logo or packaging resemble the approved brand assets?

A logo or trademark symbol is not proof of authorization. A suspicious seller may copy a logo, and a legitimate reseller may sell genuine goods without being the official store. Whether particular trademark use is permitted depends on the facts

and jurisdiction. The system must flag evidence for review not issue automatic legal judgments.

- **Official-store claim:** Does the page claim to represent the brand officially?
- **Authorization evidence:** Is the seller identified by a reliable brand or platform source?
- **Product authenticity:** Is there separate evidence concerning the goods themselves?
- **Price anomaly:** Is the comparable price unusual enough to investigate?

Escalation checklist

- [ ] Save the seller/store URL and identifiers.
- [ ] Capture the logo, official wording, badges, price and relevant images.
- [ ] Record why the observed evidence is inconsistent or incomplete.
- [ ] Check approved seller records or ask the brand owner to confirm.
- [ ] Label unresolved cases **requires review**, not “fake seller.”
- [ ] Keep any legal complaint or takedown decision with authorized human reviewers.

8. Source-of-truth rules

- [ ] Verify which brand website is official and relevant to the selling market.
- [ ] Use approved catalog, assets and authorization records as controlled references.
- [ ] Use the brand website to corroborate product identity and details—not to assume every marketplace price or batch expiry must match it.
- [ ] Keep batch expiry evidence separate from general product information.
- [ ] Save source URL, capture time, market and reference version.
- [ ] Show conflicts instead of silently choosing one source.

- [ ] Use authorized feeds or permitted page access; inaccessible pages must remain unverified.

9. Decisions needed before implementation

- [ ] First platform and country.
- [ ] Exact Accu-Chek and Nestlé/Lactogrow store URLs.
- [ ] Verified official brand websites and approved assets.
- [ ] Our seller/store identifiers and authorization records.
- [ ] First 3-4 product details to verify.
- [ ] Whether “expiry” means batch expiry, stated shelf life or minimum remaining shelf life.
- [ ] Same-brand seller comparison, competing-brand comparison, or both.
- [ ] Pricing comparison rules and alert thresholds.
- [ ] Permitted data access and agency reviewer responsible for final decisions.

Focused problem statement: Help e commerce agencies verify marketplace store identity against approved brand evidence, identify incorrect product information, compare like-for-like prices, and escalate suspicious seller behavior with a clear evidence trail starting with the store homepage.
